Problem statement:

The Objective of Crime Reporting System is to develop a web based program using which people can report crime online. It provides the facility of uploading images or videos of crime scenes to ensure that police may take action immediately. It also supplies the advice of missing persons, most wanted criminals and security tips for the awareness of people.

Presently there is no online web application available to report crime online. In order to report any complaints associated with crime, people have to contact the closest police station. People of the specific city are not aware of crime related matters such as list of Most Wanted Criminals of their town, newest crime related news, missing persons of the area etc..People must view News Channels or Read Newspaper for such offense related details. Thus we can say that the present platform is manual and does not supply all the information from 1 source.
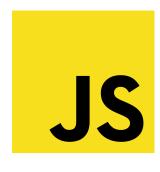

Introduction:

Crime is first reported to my website and then it is checked in the former database what is related to that crime. The found information is reported to the police. Every week a report is made which shows which type of crimes are being committed most and in which area so that police can start patrolling in that area from them.
